SYNTHETIC AUTOSAR HIGH-LEVEL DESIGN
Document ID: DEMO-HLD-001
Revision: A
Classification: Synthetic training example ? not an OEM artifact

1. System overview

The Vehicle Dynamics domain provides vehicle-speed information to braking and driver-assistance functions.

VehicleSpeedService publishes VehicleSpeedSignal through VehicleSpeedInterface.

BrakeController consumes VehicleSpeedSignal and depends on VehicleSpeedService. The signal is sampled by the vehicle dynamics layer.

2. Cabin monitoring
CabinMonitor reads CabinTemperatureSignal and DoorStatusSignal. CabinMonitor reports cabin status to
VehicleStatusManager through CabinStatusInterface. VehicleStatusManager coordinates status reporting for the
vehicle display. This example is illustrative only and is not a normative AUTOSAR design.

3. Interface summary
VehicleSpeedInterface: producer VehicleSpeedService; consumer BrakeController; payload VehicleSpeedSignal.
CabinStatusInterface: producer CabinMonitor; consumer VehicleStatusManager; payload CabinTemperatureSignal
and DoorStatusSignal.

4. Engineering review notes

Confirm interface definitions, data types, update rates, timing constraints, runnable mappings, and error handling
against the approved detailed design. Candidate dependencies extracted by InsightAI must be reviewed.
